

1 **ABSTRACT**

2 Red-eye detection based on red region detection with eye confirmation  
3 initially identifies pixels that correspond to the color of red-eye within an image.  
4 A determination is then made as to whether these identified pixels and surrounding  
5 areas are part of an eye or not part of an eye. Those identified pixels that are  
6 determined to be part of an eye are the detected red-eye regions.
